VALVES THAT REDEFINE INDUSTRY STANDARDS

Hydrant **Air Exhaust**

HYDRANT AIR EXHAUST

The Hydrant Air Exhaust (HAX) uses the technology of an Air Release Valve to make filling your water lines easy and without flooding the area. The once, time consuming, task of babysitting the hydrant is now over! Simply install the HAX and come back when the system is fully pressurized and all the air is gone!

ADVANCED FEATURES

- It's multi-port design makes pressure testing and water quality testing possible in areas that were not possible under your current system.
- Use the HAX to relieve air when you find pressure spikes in your system.
- The HAX uses a solid stainless steel body that is rated to withstand pressures up to 250 PSI
- Great for additional testing anywhere there is a fire hydrant.
